

Scotsman **PWD** freedom of installation, above any water drain!

Once more, **Scotsman sets new heights in the ice machine manufacturing standards**, with a **drain water disposal system** that allows a **smart use of space, ease of operational** as well as **enhanced ice quality and hygiene**.

The reduced footprint and height of the EC, EF and EFC ice machine ranges combined with the PWD system open new possibilities in terms of installation flexibility, as **now the water drain location is no longer a problem!**

PWD - (Progressive Water Discharge) is the smart, pressurized discharge system that will allow you to reach **remote water drains to dispose** of the left over water at the end of each production cycle, as well as the water resulting from the ice melting over time in the storage bin. A non-return valve prevents any potential drain water back-flush into the system, greatly improving the overall hygiene of the ice machine.
